

Experiment No.3
To install and configure MongoDB to execute NoSQL commands
Date of Performance:31/07/2023
Date of Submission:07/08/2023

AIM: To install and configure MongoDB/ Cassandra/ HBase/ Hypertable and to execute NoSQL commands.

THEORY:

MongoDB can be downloaded from <https://www.mongodb.com/try/download/community2>

Now open command prompt and run the following command

```
C:\>move mongodb-win64-* mongodb  
  
1 dir(s) moved.
```

MongoDB requires a data folder to store its files. The default location for the MongoDB data directory is c:\data\db. So create the folder using the Command Prompt. Execute the following command sequence.

```
C:\>md data  
  
C:\>md data\db
```

In case mongodb is stored in some other location, navigate to that folder.

In command prompt navigate to the bin directory present into the mongodb installation folder. Suppose the installation folder is D:\set up\mongodb

```
C:\Users\XYZ>d:  
  
D:\>cd "set up"  
  
D:\set up>cd mongodb  
  
D:\set up\mongodb>cd bin  
  
D:\set up\mongodb\bin>mongod.exe --dbpath "d:\set up\mongodb\data"
```

Now to run the mongodb, open another command prompt and issue the following command:

```
D:\set up\mongodb\bin>mongo.exe
MongoDB shell version: 2.4.6
connecting to: test
>db.test.save( { a: 1 } )
>db.test.find()
{ "_id" : ObjectId("5879b0f65a56a454"), "a" : 1 }
>
```

The use Command

MongoDB use DATABASE_NAME is used to create database. The command will create a new database, if it doesn't exist otherwise it will return the existing database

Syntax:

use DATABASE_NAME

The dropDatabase () Method

MongoDB db.dropDatabase () command is used to drop an existing database.

Syntax:

db.dropDatabase()

The createCollection() Method

MongoDB db.createCollection(name, options) is used to create collection.

Syntax:

db.createCollection(name, options)

Insert Document

To insert data into MongoDB collection, you need to use MongoDB's insert() or save() method

Syntax

>db.COLLECTION_NAME.insert(document)

Example:

```
>db.post.insert([
{
  title: 'MongoDB Overview',
  description: 'MongoDB is no sql database',
  tags: ['mongodb', 'database', 'NoSQL'],
  likes: 100
},
{
  title: 'NoSQL Database',
  description: 'NoSQL database doesn't have tables',
  tags: ['mongodb', 'database', 'NoSQL'],
  likes: 20,
  comments: [
    {
      user:'user1',
      message: 'My first comment',
      dateCreated: new Date(2022,11,10,2,35),
      like: 0
    }
  ]
}]
])
```

Creating sample document:

Example

Suppose a client needs a database design for his blog website. Website has the following requirements.

- ☐ Every post has the unique title, description and url.
- ☐ Every post can have one or more tags.
- ☐ Every post has the name of its publisher and total number of likes.
- ☐ Every Post have comments given by users along with their name, message, data-time and likes.
- ☐ On each post there can be zero or more comments.

Document:

```
{  
  _id: POST_ID  
  title: TITLE_OF_POST,  
  description: POST_DESCRIPTION,  
  by: POST_BY,  
  url: URL_OF_POST,  
  tags: [TAG1, TAG2, TAG3],  
  likes: TOTAL_LIKES,  
  comments: [  
    {  
      user:'COMMENT_BY',  
      message: TEXT,  
      dateCreated: DATE_TIME,  
      like: LIKES  
    },  
    {  
      user:'COMMENT_BY',  
      message: TEXT,  
      dateCreated: DATE_TIME,  
      like: LIKES  
    }  
  ]  
}
```

```
}  
]  
}
```

OUTPUT:

Show All Databases

```
mongosh mongodb://127.0.0.1:27017/?directConnection=true&serverSelectionTimeoutMS=2000&appName=mongosh+2.0.1

2023-10-03T12:02:36.648+05:30: Access control is not enabled for the database. Read and write access to data and configuration is unrestricted
-----

test> show dbs
admin  40.00 KiB
config 12.00 KiB
local  40.00 KiB
test> use myTestDb
switched to db myTestDb
myTestDb> db
myTestDb
myTestDb> db.createCollection("Employee");
{ ok: 1 }
myTestDb> |
```

To check collections list

```
myTestDb> db.createCollection("Employee");
{ ok: 1 }
myTestDb> show collections
Employee
myTestDb> |
```

Insert document in collection

```
myTestDb> db.Employee.insert({id:1 , name:'Samarth', address:'Pune'})
DeprecationWarning: Collection.insert() is deprecated. Use insertOne, insertMany, or bulkWrite.
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c386283769c4480038873") }
}
myTestDb> db.Employee.insert({id:2 , name:'Shubham', address:'Ratnagiri'})
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c387883769c4480038874") }
}
myTestDb> |
```

To insert multiple documents in selected collection

```
myTestDb> db.Employee.insert({id:3 , name:'Dharmesh', address:'Malvan'}, {id:4, name:'Hrushikesh', address:'kochi'})
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c394183769c4480038875") }
}
myTestDb> |
```

Get collection document

```
myTestDb> db.Employee.find().pretty()
[
  {
    _id: ObjectId("651c386283769c4480038873"),
    id: 1,
    name: 'Samarth',
    address: 'Pune'
  },
  {
    _id: ObjectId("651c387883769c4480038874"),
    id: 2,
    name: 'Shubham',
    address: 'Ratnagiri'
  },
  {
    _id: ObjectId("651c394183769c4480038875"),
    id: 3,
    name: 'Dharmesh',
    address: 'Malvan'
  }
]
myTestDb> |
```

Update document

```
myTestDb> db.Employee.update({name:'Dharmesh'},{$set:{name:'Hrushikesh'}})
DeprecationWarning: Collection.update() is deprecated. Use updateOne, updateMany, or bulkWrite.
{
  acknowledged: true,
  insertedId: null,
  matchedCount: 1,
  modifiedCount: 1,
  upsertedCount: 0
}
```

```
myTestDb> db.Employee.find().pretty()
[
  {
    _id: ObjectId("651c386283769c4480038873"),
    id: 1,
    name: 'Samarth',
    address: 'Pune'
  },
  {
    _id: ObjectId("651c387883769c4480038874"),
    id: 2,
    name: 'Shubham',
    address: 'Ratnagiri'
  },
  {
    _id: ObjectId("651c394183769c4480038875"),
    id: 3,
    name: 'Hrushikesh',
    address: 'Malvan'
  }
]
```

Drop collection

```
myTestDb> db.Employee.drop()
true
myTestDb> |
```

Drop database

```
myTestDb> db.dropDatabase()
{ ok: 1, dropped: 'myTestDb' }
```

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

CONCLUSION:

This experiment focused on installing and configuring MongoDB, a popular NoSQL database, to perform NoSQL commands. We successfully installed and customized MongoDB to meet specific needs, including security and performance requirements. We also learned how to use NoSQL commands for various database operations, such as inserting, querying, and indexing data. MongoDB demonstrated scalability and performance for unstructured data, making it a suitable choice for NoSQL applications. The availability of comprehensive documentation and community support contributed to the success of the experiment, and we gained valuable skills for efficient NoSQL data management using MongoDB. In simpler terms, we learned how to install and use MongoDB, a NoSQL database, to store and manage unstructured data. We also learned how to use NoSQL commands to perform various database operations. MongoDB is a good choice for NoSQL applications because it is scalable and performs well with unstructured data. There is also a lot of documentation and support available for MongoDB, which makes it easy to learn and use.
